Summary

Protect sensitive data on Laptops, PCs and external mass storage devices

Sensitive and valuable data must be protected. That applies especially to mobile devices which bring a higher risk of unauthorized access and breaching of confidential information.

Secure Device creates an encrypted area, called a secure vault on your hard disk or external mass storage device to protect data from unauthorized access in case of loss or theft. Data copied into the secure vault gets automatically encrypted. Accessing the secure vault requires prior password authentication.

Transparent Data Encryption

Secure Device works with standardized security mechanisms and delivers data protection providing for very high user friendliness and ease of use.

Simple Integration / Central Administration

Secure Device can be easily installed and deployed using standard software rollout technology like Microsoft SMS and its Active Directory integration ensures simplified central management through Group Policies.

Simplified Usage

The simplified installation, distribution and administration of Secure Device, translates into easy and quick usage, as well reduced administration efforts. This guarantees cost-effective usability.

Password Recovery

A special password recovery mechanism protects the users in the case of password losses.
